Guided by his passion for helping those less fortunate, Jonathan has developed an affordable prosthetic arm for people in underdeveloped countries with the help of his team, Illini Prosthetics Team. Putting aside his initial focus to make a state-of-the-art prosthetic arm with electronic components, Jonathan has created an arm from recycled materials that is extremely functional, durable and easily manufactured. In his development of this product, Jonathan will travel to Guatemala in the summer of 2010 to field test the prototype at a prosthetics clinic. He is currently creating a plan to start a production facility in a developing east African nation that will supply prosthetic arms to amputee populations in Sierra Leone and Liberia.
